

## Water Management Policy

DynaVat Gold Mining Technologies (DynaVat) confirms its commitment to the right of people to have clean water. We recognize the importance of being a responsible steward of the water resources we use. Our water management policy and its associated procedures address our current and future activities to ensure the continued protection of water resources and their quality. These guiding principles will be applied through our commitments to:

- Seek opportunities to reduce our water use and to re-establish the drainages and groundwater levels at closure.
- Investigate and employ all technologies available to recycle and reuse all process water.
- Measure and publicly disclose water consumption, extraction, discharge, and recycle rates every year.
- As part of a participatory monitoring program, monitor water quality in the environment around our operations, and disclose this water quality data, and that of our discharge to the receiving environment.
- Define, maintain, and disclose operational water balances and water management plans for our operations that are reviewed at least annually.
- Assess water supply risks at least annually at the local and catchment levels for our operations and local / regional communities with a specific focus on climate change.
- Consult with communities and stakeholders to provide information about our protection and management of water resources in a meaningful and transparent manner.
